

Phishing Detection & Awareness Report

Submitted by : Eede Deva Harshini
Internship Domain : Cyber Security
Organization : Future Interns
Task : Phishing Detection & Awareness System
Submission Date : 26/05/2026

Introduction

Phishing is one of the most common cyber security attacks used to steal sensitive information such as usernames, passwords, banking details, OTPs, and personal data. Attackers create fake emails, websites, or messages that appear to come from trusted organizations in order to trick users into revealing confidential information. These phishing emails often contain malicious links, urgent messages, fake login pages, or suspicious attachments.

The purpose of this project is to identify phishing indicators, analyze suspicious emails, and create awareness about email-based cyber threats. Different email samples were examined to detect fake sender addresses, spoofed domains, malicious links, grammar mistakes, and social engineering techniques commonly used in phishing attacks.

This project also focuses on classifying emails as Safe, Suspicious, or Phishing based on their content and behavior. The analysis helps users understand how phishing attacks work and how cyber criminals manipulate individuals through fear, urgency, or fake rewards.

In addition, the project provides prevention and awareness guidelines to help users stay safe online. Following proper cyber security practices such as verifying email senders, avoiding unknown links, enabling multi-factor authentication, and protecting personal information can reduce the risk of phishing attacks.

Overall, this project improves understanding of phishing detection, cyber awareness, and security reporting while promoting safe digital communication practices.

Objectives

- Identify phishing indicators in emails
- Detect fake sender addresses and malicious links
- Classify emails as Safe, Suspicious, or Phishing
- Explain cyber security risks in simple language
- Provide prevention and awareness guidelines

Sample Email Analysis – 1

Email Type:

Fake Bank Verification Email

Screenshot:

Indicators Identified:

- Suspicious sender address
- Urgent warning message
- Fake login link
- Grammar mistakes

Risk Level:

High Risk

Classification:

Phishing

Explanation:

This email attempts to scare users by claiming that their bank account will be blocked. The link redirects users to a fake website designed to steal login credentials.

Sample Email Analysis – 2

Email Type:

Fake Prize Winning Email

Screenshot:

Indicators Identified:

- Unrealistic reward offer
- Unknown sender
- Suspicious external link

Risk Level:

Medium Risk

Classification:

Suspicious / Phishing

Explanation:

The email promises a fake reward to attract users into clicking malicious links or sharing personal information.

Prevention & Awareness Guidelines

- Do not click unknown links
- Verify sender email addresses carefully
- Avoid downloading suspicious attachments
- Never share passwords or OTPs through email
- Use multi-factor authentication
- Check website URLs before logging in
- Keep antivirus and browser security updated

Conclusion

Phishing attacks are one of the most common cyber threats affecting individuals and organizations. Identifying phishing indicators and following safe online practices can help prevent data theft and financial loss. This project improved understanding of phishing detection, cyber awareness, and email threat analysis through practical examples and security reporting.
